Attention: Vic Hodges

Dear Vic;

I would like to thank you for introducing us to your Metalon products; C2 and Metalon Hi-Tech grease.

We have been using the grease for 18 months and have had a considerable reduction in driveline and "U" joint failures.

The introduction of C2 into the hydraulic system in our blender solved one of our major problems. We operate this equipment from -40°F to $+90^{\circ}\text{F}$. The hydraulic oil would have to be changed twice a year to accommodate the wide temperature range. By adding C2 at 10% we are able to use winter hydraulic oil year round. During our testing of C2, we operated the blender under load to a maximum temperature of 160°F without C2 first. Then we added the C2 and performed the test again. The maximum temperature we reached was 100°F . The C2 removed 60°F of heat from the hydraulic oil. the temperature limits of the lubricating quality of the winter oil is from -35°F to $+114^{\circ}\text{F}$. We can safely use this oil year round.

Thank you.

Yours truly,

Wayne Hodges
